## CloudVision Workshop 2026

### Section 3 : Onboarding with Advanced Studios

# Studios Usage Model — Static vs. Built-in

## STATIC CONFIGURATION STUDIO

### Configuration-Centric

- You define the explicit, final EOS configuration you want applied to devices.
- EOS CLI syntax is entered directly by the user in CloudVision using a text-editor style front-end interface.

***“I know the EOS configuration I want, put this configuration on these switches.”***

## BUILT-IN STUDIOS (ADVANCED)

### Intent-based / Model-Centric

- Provides a structured, data-driven model for configuring specific network functions.
- Describe the desired state rather than writing configuration manually—the Studio automatically generates appropriate EOS code.

***“CloudVision, this is what I want the network to look like—generate the device configuration required to accomplish it.”***

# Studios Usage Model — Static Configuration Studio

## PROS OF STATIC STUDIO

### Key Advantages

- **Flexibility:** Device configuration can be a single file or a collection of configlets (modular). Excellent for unique, one-off, or specialized configurations.
- **Familiarity:** Leverage existing knowledge when engineers already know EOS configuration.
- **Robust:** You can configure essentially any EOS feature available through CLI.
- **Migration:** Easy way to migrate existing CLI configurations into CloudVision management.

## CONS OF STATIC STUDIO

### Key Considerations

- **Responsibility:** You are responsible for understanding the CLI and designing the configuration correctly.
- **Guardrails:** Less abstraction and fewer guardrails.
- **Repetition:** Could be more repetitive when applying similar configurations across many switches.
- **Scaling Complexity:** Requires tribal knowledge of how configlets are named and applied within the hierarchy.
- **Lack of Intent:** CloudVision understands less about the *intent* behind the configuration and cannot “self-heal”.

# Studios Usage Model — Built-in Studios

## PROS OF BUILT-IN STUDIOS

### Key Advantages

- **Consistency:** The same configuration logic is applied across devices.
- **Scale:** Much easier to configure hundreds or thousands of similar devices/interfaces.
- **Guardrails:** Structured inputs reduce configuration mistakes.
- **Abstraction:** Engineers don't necessarily need to know every underlying EOS command.
- **Easier lifecycle management:** Changing the underlying data can systematically change configuration across many devices.

## CONS OF BUILT-IN STUDIOS

### Key Considerations

- **Scope Limits:** Unusual or highly unique configurations may not be within any built-in Studio.
- **Learning Curve:** Engineers need to learn the Studio's data model and hierarchy.
- **Troubleshooting:** Sometimes requires understanding both the Studio inputs and the EOS configuration they generate.
- **Feature Gap:** New EOS capabilities may exist before the corresponding built-in Studio exposes them.

# Studios Usage Model - Order of Precedence

What happens when multiple studios are applying configuring to a device?
